Equivalences

In Computation Tree Logic (CTL) the model of time is a tree-like structure. This way, we cannot use Linear Temporal Logic (LTL) to express the existence of a certain path of time in which some event occurs.

The propositional operators: $\neg, \vee, \wedge, \rightarrow$ have the same meaning of in the propositional logic.

The temporal operators can be read (if φ is a formula) as follows:

- $A\varphi$: φ is true in all possible paths;
- $E\varphi$: φ exists a path in which ϕ is true;

The path-specific operators can be read, considering φ and ψ formulas, as:

- $X\varphi$: φ is true until next state;

The propositional operators: $\neg, \vee, \wedge, \rightarrow$ have the same meaning of in the propositional logic.

The temporal operators can be read (if φ is a formula) as follows:

- $A\varphi$: φ is true in all possible paths;
- $E\varphi$: φ exists a path in which ϕ is true;

The path-specific operators can be read, considering φ and ψ formulas, as:

- $X\varphi$: φ is true until next state;
- $F\varphi$: There is some state in the future where φ is true;

The propositional operators: $\neg, \vee, \wedge, \rightarrow$ have the same meaning of in the propositional logic.

The temporal operators can be read (if φ is a formula) as follows:

- $A\varphi$: φ is true in all possible paths;
- $E\varphi$: φ exists a path in which ϕ is true;

The path-specific operators can be read, considering φ and ψ formulas, as:

- $X\varphi$: φ is true until next state;
- $F\varphi$: There is some state in the future where φ is true;
- $G\varphi$: Globally (in all future states) φ is true;

The propositional operators: $\neg, \vee, \wedge, \rightarrow$ have the same meaning of in the propositional logic.

The temporal operators can be read (if φ is a formula) as follows:

- $A\varphi$: φ is true in all possible paths;
- $E\varphi$: φ exists a path in which ϕ is true;

The path-specific operators can be read, considering φ and ψ formulas, as:

- $X\varphi$: φ is true until next state;
- $F\varphi$: There is some state in the future where φ is true;
- $G\varphi$: Globally (in all future states) φ is true;
- $\varphi U\psi$: φ is true at least until ψ becomes true;

- Notice that, in CTL, the combination of path specific operators and temporal operators are atomic, i.e., AF is a operator that can be read as “In all paths in the future there is some state where...”

- Notice that, in CTL, the combination of path specific operators and temporal operators are atomic, i.e., AF is a operator that can be read as “In all paths in the future there is some state where...”
- Notice as well that the binary operators $A[\varphi U \psi]$ and $E[\varphi U \psi]$ can be represented as AU

- Notice that, in CTL, the combination of path specific operators and temporal operators are atomic, i.e., AF is a operator that can be read as “In all paths in the future there is some state where...”
- Notice as well that the binary operators $A[\varphi U \psi]$ and $E[\varphi U \psi]$ can be represented as AU
- We assume that, similarly to the \neg operator, the “new” unary operators (AX , EX , AF , EF , AG , and EG) have the first precedence. Next comes the \wedge and \vee operators. And at last the \rightarrow , AU and EU

Take an arbitrary model \mathcal{M} . Let s, s_1, s_2, s_3 be states in S . Let $\varphi, \varphi_1, \varphi_2$ be well-formed formulas of CTL. And let p be an atom. The satisfaction of CTL formulas can be defined as follows:

- $M, s, \models \text{AF}\varphi$ iff for all paths $s_1 \rightarrow s_2 \rightarrow s_3 \rightarrow \dots$ in which $s = s_1$, exists s_i , $M, s_i \models \varphi$. Thus, AF says: “In all possible paths from now on, in some next state...”
- $M, s, \models \text{EF}\varphi$ iff exists some path $s_1 \rightarrow s_2 \rightarrow s_3 \rightarrow \dots$ in which $s = s_1$, that exists s_i , $M, s_i \models \varphi$. Thus, EF says: “In some path from now on, in some next state...”
