In Computation Tree Logic (CTL) the model of time is a tree-like structure. This way, we cannot use Linear Temporal Logic (LTL) to express the existence of a certain path of time in which some event occurs.

Let *Atoms* be a set of atomic formulas. A **transition system** or **model**  $\mathcal{M}$  is a triple  $\mathcal{M} = (S, \rightarrow, L)$  in which  $S$  is a set of states,  $\rightarrow$  is a binary relation over  $S$  ( $\rightarrow \subseteq S \times S$ ) such that for every state  $s \in S$ , exists a  $s'$  that  $s \rightarrow s'$  and  $L : S \rightarrow \mathcal{P}(\text{Atoms})$  (or  $L : S \rightarrow (\text{Atoms} \rightarrow \{0, 1\})$ ) is a labelling function.

CTL formulas are satisfied by a transition system and a specific state.

**Notation:** we will use  $\mathcal{M}, s \models \varphi$  to denote that the model  $\mathcal{M}, s$  satisfies the formula  $\varphi$

Because of the equivalences shown and the ones in propositional logic, we can have some minimum sets of connectives for the CTL syntax. One of them is defined in Backus-Naur formalism below:

$$\phi ::= \perp \mid p \mid \neg\phi \mid \phi \wedge \phi \mid EX\phi \mid AF\phi \mid E[\phi U \phi]$$

Even if CTL allow explicit quantification over paths, it cannot allow some expressions to be formed. For example, we cannot say, as in LTL: "All paths in which have  $p$  on them, also have  $q$  on them".

This expression can be translated in LTL as follows:

$$Fp \rightarrow Fq$$

# That's all we need?

We can try expressing it as  $AFp \rightarrow AFq$  but it does not have the same meaning. This one statement means "If all paths have a  $p$  along them, then all paths have a  $q$  along then"

We can try to translate it as  $AG(p \rightarrow AFq)$  which is closer, but not exactly the same. This one means "for all paths, in all states on the future, if they hold  $p$  then, all paths will eventually hold  $q$ "
