# Definition

Let Atoms be a set of atomic formulas. A **transition system** or **model**  $\mathcal{M}$  is a triple  $\mathcal{M}=(S,\to,L)$  in which S is a set of states,  $\to$  is a binary relation over S ( $\to\subseteq S\times S$ ) such that for every state  $s\in S$ , exists a s' that  $s\to s'$  and  $L:S\to \mathcal{P}(Atoms)$  (or  $L:S\to (Atoms\to \{0,1\})$ ) is a labelling function.

CTL formulas are satisfied by a transition system and a specific state.

**Notation:** we will use  $\mathcal{M}, s \vDash \varphi$  to denote that the model  $\mathcal{M}, s$  satisfies the formula  $\varphi$ 

# Semantics Satisfaction

### Computation Tree Logic

#### Luis Tertulino & Ronaldo Silveira

Semantics of CTL

#### semantics Equivalences

Improving our language

Because of the equivalences shown and the ones in propositional logic, we can have some minimum sets of conectives for the CTL syntax. One of them is defined in Backus-Naur formalism below:

$$\phi ::= \bot \mid p \mid \neg \phi \mid \phi \land \phi \mid EX\phi \mid AF\phi \mid E[\phi U\phi]$$

# That's all we need?

### Computation Tree Logic

How to communicate Syntax of CTL Semantics of CTL

Some examples o what we can say More about semantics

semantics Equivalences Improving our language Even if CTL allow explicit quantification over paths, it cannot allow some expressions to be formed. For example, we cannot say, as in LTL: "All paths in which have p on them, also have q on them".

This expression can be translated in LTL as follows:

$$Fp \rightarrow Fq$$

# That's all we need?

How to communicate Syntax of CTL Semantics of CTI

More about semantics

Improving our language

We can try expressing it as  $AFp \to AFq$  but it does not have the same meaning. This one statement means "If all paths have a p along them, then all paths have a q along then" We can try to translate it as  $AG(p \to AFq)$  which is closer, but not exactly the same. This one means "for all paths, in all states on the future, if they hold p then, all paths will eventually hold q"

Improving our language

The syntax of CTL\* can be defined with the BNF bellow:

$$\phi ::= \bot \mid \top \mid p \mid \neg \phi \mid \phi \land \phi \mid \phi \lor \phi \mid \phi \rightarrow \phi \mid A[\alpha] \mid E[\alpha] \mid$$

$$\alpha ::= \phi | \ \neg \alpha \ | \ \alpha \wedge \alpha \ | \ \alpha \vee \alpha \ | \ \alpha \rightarrow \alpha \ | \ \alpha \textit{U} \alpha \ | \ \textit{G} \alpha \ | \ \textit{F} \alpha \ | \ \textit{X} \alpha |$$

With the same meanings of each operator.
